

# Industry one-pager • Logistics & freight tracking

Shipment lookup · exception push · 7×24 self-service cost down

Case summary · anonymized · for internal forwarding · Version 2026-07-30

Confidence note: Pilot used 500 historical desensitized shipments over 14 days. Results are indicative, not a service SLA.

## 1. Customer background & pain

Mid-size freight forwarder: customers and ops staff constantly asked for shipment status, ETA, and exception reasons.

Manual replies were slow at night and weekends; tickets piled up in the service queue.

## 2. Solution scope

Agent connected to TMS for live status. Exception shipments notify the responsible ops owner automatically.

After ~30 days, human service tickets dropped ~35%; satisfaction improved on self-serve lookups.

## 3. Integration & escalation

Read-only TMS fields for tracking; write-back only where ops explicitly configures it.

Unclear answers escalate to human with conversation context — no silent dead-ends.

## 4. Pilot design

14-day pilot, 500 desensitized historical shipments to validate query accuracy.

Exception push rules owned by the ops lead; channels include in-app and IM notify.

## 5. Next steps

Review logistics industry pack scenarios and integration checklist with IT.
